In the code below that was copied from the parsing page we have, what is advance supposed to return. I am confused as what tree=advance(); is doing. I would have thought we would call tree =match("something")?

```javascript
function op()
{
    var tree;
    //the tree is the operator that was found
    if (check(PLUS)) tree = advance();
    else if (check(MINUS)) tree = advance();
    ...
    else if (check(ASSIGN)) tree = advance();
    ...
    else if (check(LESS_THAN)) tree = advance();
    else tree = match(LESS_THAN_OR_EQUAL);

    return tree;
}
```
