In Task 1 there is a sentence:

Here is an example of equivalent calls to if and my-if that behave exactly the same, in terms of output:

It should be calls to and and my-and.

For Task 3, it says you used array and getElement, but above the tasks section it states that we cannot use lists or arrays.

---

Fixed.

In task 3, you may use array and getElement (but as noted, they are not necessary).

---

In Task 5 there is the line:
The function bico can be described via the following recurrence:

but the recurrence is not given.

Also, I don't understand what Task 3 is asking. Pete and I tried to interpret what the shifting means, but can't figure it out.

By a left shifted quarter, do you mean taking the sin(pi/2 + x), where x is the value 0 to 100?

---

I removed the reference to a recurrence.

I will generate some sine wave images that correspond to the scaling and add them this weekend.
