Does this need to work for negative numbers?

No. But it would be trivial to do.

Subject: Re: Problem 8  

Should (egypt/ 14 3) equal 4 or 4.66666666667?

Quote: In either case, we halve (integer division) the values in both columns a and b. We stop when column a becomes less than 1. At this point, the answer resides in column d.

Quote: If the number in column b is less than or equal to that of column c, we add column a to column d

Therefore, the answer has to be an integer.
