So basically in the case that handles parentheses, my comparison is coming out as false for both "(" and ")". I'm expecting one to be true and the other to be false. Can someone explain to me what I am doing wrong?

curr is the current node that I am reading from my queue and data is the value of that current node.

```c
if(curr->data->sval == ""){
    //do something
}
if(curr->data->sval == "("){
    //do something
}
```

Try this:

```c
if(strcmp(curr->data->sval, ")") == 0)
{
    //do stuff
}
```

Or:

```c
if (*(curr->data->sval) == '(')
```
