During the bst order check the avlchecker is comparing "g+" and "g f p" which is causing an BST ordering error, but the + is the favorite indicator of "g" and should not be in the string for comparison.

Will this just an uncaught error for the avlchecker or is this how it is going to be graded?

Good catch. I've put a fixed version (version 3) up on beastie.

wget beastie.cs.ua.edu/cs201/avlchecker.tgz
