I get trailing zeros when coercing reals to strings and strings to reals.

Example: 32.11412  -> "32.114120"
          "5.33920"  -> 5.3392000000

Is this type of behavior ok? Or do we need to implement the coercion to where the two types will look identical when converting between the two? I'm currently just using (real) and (string).
