I thought it would be a good idea for us to share our boundary tests. We'd like to think we have tested everything, but we don't know what we don't know!

I'll start:

- Test Union with an empty list  
- Test removing all the items from a list, then adding again.  
- Test DLL can display the items in reverse (this won't be tested but it could help ensure your links go both ways)

- Testing with values other than integers

This thread is a good idea.

How about using union to pass from one list to another, then back again?

I personally put a for loop running around a million times, using union to swap between two lists every time, to make sure it ran in constant time.
- Printing sizes of both lists before and after Union

Will there be a test for trying to union a list with itself? i.e. unionSLL(items, items); Because right now, my union function ends with setting donor->head and donor->tail to NULL, causing that function call to result in "items" being empty instead of [1,2,3,4,1,2,3,4] for example.

^ That would be considered invalid input, but great outside-the-testing-dropbox thinking.
