To clarify what the flags mean:

-d is decimal
A decimal is any number with a decimal point, rational and irrational?
EX: [1.2, 8.343434, 54.00, 23.9287483274]

-r is real
A real number is any number, rational and irrational?
EX: [5, 2, 234, 667, 1.2, 8.343434, 54.00, 23.9280934723]

-s is string
A string of characters
EX: ["string", "new string", "yet another string 45"]

I'm trying to figure out which standard data types to use, and I do not see a difference between
decimal and real. At first I thought that maybe real was referring to an integer, but that is not what
a 'real' number is. I am assuming, now, that we should use:

float for -d (6 decimal places)
double for -r (15 decimal places)
char * for -s (string)

I'm sure the -d means integer objects.

In the decimal numeral system the values are the integers base 10. That is why printf uses %d.

Wow... Just... Wow...
I feel like deleting this... But I'm going to leave it up in case I am not the only one... Please, I hope that I'm not the only one...

Thought d is dragon, r is rabbit, s is squirrel.

^ I'll make an exception to the no posting code rule. Please post your displayDragon and your dragonComparator functions. I'm curious!

DisplayDragon? I think this runs in O(1) time.

Nice. Still looking for the comparator, though.

void displayDragon(void)
{
    int n;
    printf("How many dragons would you like to display?\n");
    scanf("%d", &n);

You should surround your code with [code][/code] (remove spaces from inside of brackets) to make it display correctly.

Subject: Re: Real, Decimal, and String Clarification
void displayDragon(void)
{
    int n;
    printf("How many dragons would you like to print?\n");
    scanf("%d", &n);
    int i;
    for (i = 0; i < n; i++)
    {
        printf("/===-____________~\n");
        printf("==\\\n");
        printf("\n");
        printf("\n");
        printf("\n");
        printf("\n");
        printf("\n");
        printf("\n");
        printf("\n");
        printf("\n");
    }
}
Gotta love ASCII art, real old school!

So will our run command always include a flag for the type?

It seems that it will. I have assumed that it will.

Yes, your program will always be called with an option. However, you can have your program default to a type if an option is not present on the command line.
