I see from the first-round test results that pop and dequeue have two parameters, but on the assignment0 page it only displays them both as having a single parameter.

Pop only takes one parameter, a stack. Dequeue also only has one parameter, a queue. The test incorrectly states that it is popping or dequeuing from certain indexes; this is not the behavior or pop or dequeue.

The email shows pop(a,2);, etc. As it does @ http://beastie.cs.ua.edu/cs201/assign0-tests. Check Test #24 for example.

Welp that's not how pop or queue is intended to work, and furthermore, it ran successfully on my program which takes the single parameters I described, so I think something about the test is false.

I also had pop and dequeue take in a single parameter and mine worked for most of the test.
That's an error in the test description.
