Did anyone who failed 22 the first time figure out how to pass it this time? I tested it on my computer by using loops to do the repeated inserts and deletes and it worked. So I can't figure out why it's still not working when tested. Any insight as to what could be causing the problem?

According to the spec, you have to make deletions a constant distance from the end constant. So basically, for DLL, you need to edit your delete function such that it tests for where in the list the index to be deleted is, and then either starts iterating from the head or the tail.
