Subject: checkBST function
Posted by Logand064 on Sat, 25 Feb 2017 21:24:49 GMT

The checkBST function says optional, but I don't see a description of what the function is supposed to achieve. Can anybody explain what that function is expected to do?

If you want to implement it, it should check your bst to see if it has bst ordering. A check function for a rbt would do that as well as check black height as well as check for any red-red violations.
