I have passed all of my tests, except for the two where BST and VBST are tested with "alternate code".

How in the world do I go about debugging this? Will this "alternate code" be provided? I am curious to see exactly what specifications my modules violate, as all other tests without the replaced code are successful.

Line 65: \texttt{int compare = myBST->compare(myVal, cursorNode->value);}  

During the first insert, your cursorNode was null at this point.

Is there any way we can submit our corrections on these tests to the testing module to work with your code? Otherwise I'm not sure how to confirm the test won't fail on sub 2.

You can submit to my debug drop box and send me a note. No guarantees that I can get to it, but I will try.
