Subject: "Out of memory" Error

I have completed assign3 and have submitted it to the test dropbox. I pass every test, except for the last one, which replaces code to test out the Binomial module. This fails, and only tells me "out of memory". I know someone else with the exact same issue.

I know this doesn't give us much information, but while I am waiting for Dr. Lusth to look at my code, does anyone have any ideas of how this could be happening? The module runs without error on every other test. There are no obvious memory leaks.

I'm having the same issue, not sure what's going on

Dr Lusth had stated it was something due to my comparisons being made, updated them but still out of memory error

Did you get a core dump?

My issue was solved. It was that I was going from the highest to lowest index when looping through the donor array in mergeBinomial. If I went from lowest to highest I did not get the error.
